1. Create two variables:

- isRaining → set it to true
- isHoliday → set it to false

Print both values and print their types using typeof.

2. Write code that:

- stores a number in a variable
- then reassigns it to a string
  Print the type each time.

3. Create a variable firstName and store your name.
Create another variable lastName.
Concatenate them **without spaces** and print the result.

Now again print them using:

- template literals with spaces
- normal concatenation with " " in between

4. Given:
let word = "JavaScript";

Do the following:

- Print the first character
- Print the last character without hardcoding
- Try to change the first character to "K" → print and observe what happens

5. Write three strings:

- One with single quotes inside double quotes
- One with double quotes inside single quotes
- One using escape characters like \'

6. Here is the code

let color = "   blue ";

Do the following:

- Print color.length
- Trim the string
- Convert it to uppercase (chaining allowed)
- Print the final result

7. Here is the code
let song = "Never gonna give you up!";

Write code to find:

- index of "give"
- index of "z"
  Print both results.

8. Here is the code
let sport = "Cricket";

Write code:

- slice from index **2** onward
- slice from index **1 to 4**
- slice using values that produce an empty string

9. Here is the code
let msg = "I love cats. Cats are amazing!";

Replace only the **first** "cats" with "Dogs".

10. Check if "Java" exists inside "I love JavaScript".
Check again starting from index 5.
Print both results.

11. Here is the code
let fruits = "apple,banana,grapes";

Split it:

- by comma
- by empty string ("")

- by "an"

12. Create a multiline message using backticks

Output:

Hello John!
Welcome to JavaScript class.
Have fun coding!

13. Create a sentence using template literals
let lang = "JavaScript";
let year = 1995;

Output using template literals:
JavaScript was created in 1995!
